

WTC Transportation Terminal

Inspired by armor, the new WTC transportation terminal connects the red line, yellow line, and all walk routes in between WTC buildings to the memorial.

Curving concrete structures encasing open steel trusses create a strong shell as well as a bright atrium area as the light bounces off the white concrete surfaces.

The diagonal structural truss cased in concrete also doubles in areas as escalators for circulation.

The juxtaposed hollow volumes create passageways for travelers on foot as well as voids for entering light.

The building hugs the ground becoming part of the landscape.
