01. HUMAN BONDING

Mixed-use Residence Apartment + Student Dormitory + Public Plaza + Library + Retail Stores
 Location 11th ARR., Paris, France
 Spring 2017 GSAPP Advanced Architectural Design Studio
 Exhibition Columbia GSAPP End of Year Show 2017
 Instructor Umberto Napolitano
 Individual Work

Human Bonding aims to revitalize typical Paris city blocks with increased green space and plaza that are accessible to the public. By introducing winding streets within the block that are connected to the two boulevards on the opposite sides, the design intends to rebuild the deteriorating micro neighborhood and community relations affected by Haussmann's urban planning directions in the mid-19th Century. The architecture and site plan of Human Bonding also challenge Paris' repetitive and highly unified streetscapes. The new scheme encourages people to linger, to meet, and to connect with one another while ensuring residents' privacy and identity are preserved.

02. PARADOX EFFICIENCY_REIMAGINING LGA

Airport Terminal Boarding Green Belt + Worry-Free Security and Customs + Library + Gallery + Check-In + Retail + Arrivals
 Location LaGuardia Airport, Queens, New York, USA
 Fall 2016 GSAPP Advanced Architectural Design Studio
 Instructor Marc Tsurumaki
 Individual Work

The core focus of Reimagining LGA is to streamline the check-in process at the airport while creating a stress-free atmosphere for visitors at both arrivals(Land Side) and boarding area(Air Side). Spatial configuration and program adjacency are constructed and revolved around the key principal - "Visual Efficiency". The Boarding Green Belt at ground level is surrounded by three stories high curtain walls through out the complex where visitors are visually connected yet restrained within controlled designations for security purposes - a fluctuating paradox. As new screening technology emerges, security and customs section are creatively incorporated into the main circulation bridge between check-in area and boarding area. This strategic move allows Reimagining LGA to accommodate additional program, such as galleries, gyms, playgrounds, and archives, and be positioned as a next-gen transit hub.

"Pancake Design" at Conventional Airport

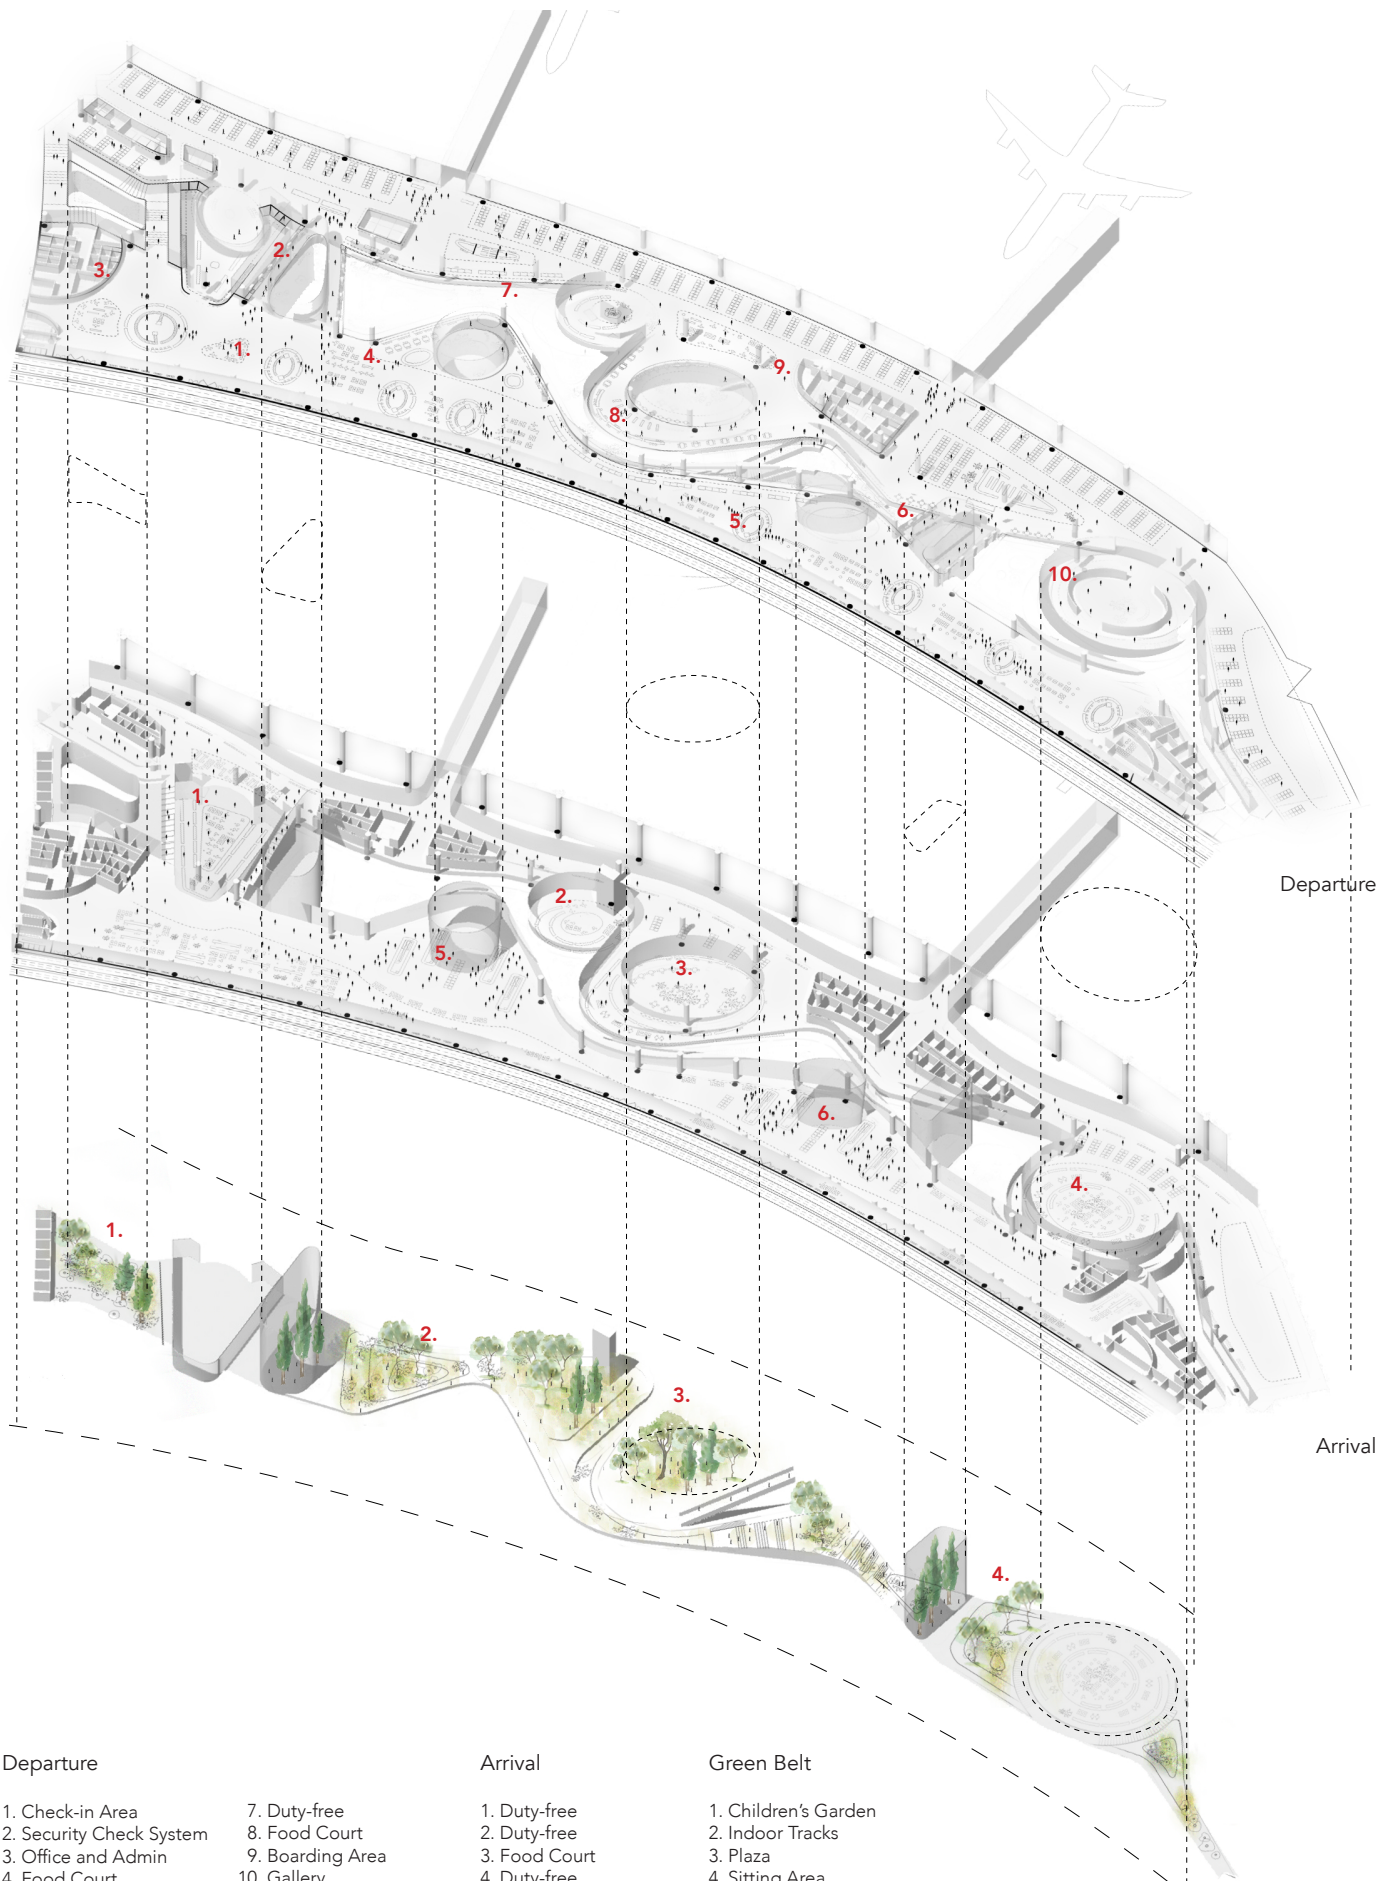

"Visual Efficiency" at Shopping Mall

Paradox Efficiency

Instead of relying on "Pancake Design" strategy commonly adapted in conventional airport design, Reimagining LGA brings in the successful "Visual Efficiency" method from shopping mall layout and fuses the two which results in a new building typology and hierarchy - Paradox Efficiency. Visitors on all floors are always visually connected with the surrounding programs and the Green Belt through out their journey within the complex. The environment soothes the mental nerves of traveler that no previous transit hub could provide.

03. URBAN CANOPY

Mixed-use Development Elevated Museum + Indoor/Outdoor Market + Affordable Housing + Workshop + Gallery
 Location Lower East Side, Manhattan, New York, USA
 Fall 2015 Iowa State Design Studio 402
 Instructor Jungwoo Ji
 Team Shaohua Dong, Yi Zhi Yew
 Contribution Design Lead, Site Analysis, Visual Representation Lead, Physical Model, and Writing

Manhattanism is the one urbanistic ideology that has fed, from its conception, on the splendors and miseries of the metropolitan condition—hyper-density—without once losing faith in it as the basis for a desirable modern culture. Manhattan's architecture is a paradigm for the exploitation of congestion."

-Rem Koolhaas

Located adjacent to the Essex Street Market at lower Manhattan, New York, Urban Canopy consists of three equally important programs - museum, extension of the market, and affordable housing. The formation of the multi-function complex takes full advantage of timber's material property and structural capacity where green spaces are hierarchically classified and deeply integrated with the timber framework to address the transition space between public, semi-public, and private zones. Galleries, gym, playground and archive are stitched accordingly to various green spaces cultivating social exchanges as part of the community driven design concept.

Ground Floor Plan

At ground level, in collaboration with the on-site museum and Essex Market extension, seasonal auctions and pop-up exhibitions are hosted at the open courtyard situated at the west wing of the complex. For privacy and security concerns, the east courtyard, though still open to public, is mainly dedicated to residents of Urban Canopy. Both courtyards are well accessible from all sides of the complex through four main entrances with loading decks provided to allow business shipping and delivery during off-peak hours.

Structural Analysis

Timber is selected for most part of the construction in Urban Canopy for its renewable property and expedient in affordable construction. While building facades, canopy system, floor plates, vertical structures, and walls are made from wood, the gravity interlocking joint system sets the complex to a new height in term of sustainable architectural design.

Program Tendency

After an in-depth research responses to concerns over public vs private program tendency, a spatial arrangement hierarchy is assigned to museum, market, residence, and associated spaces. Museum(public), consists of galleries, an auditorium, and a workshop for people of all ages to explore design ideas. Market(semi-public) is divided into permanent and flexible sections to boost continuous foot traffic and seasonal sales. Studio, one bedroom apartment, and two bedrooms apartment are available for the affordable housing market.

Urban Canopy Activities

Looking down at the courtyard standing in the museum gallery space, the flexible hanging structures, suspended from the canopy, generate vivid shading in the day time at the gathering space below. The hanging structures also double as displays for fresh products, rotational art installations, and greeneries depending on the seasonal activities in the open courtyard.

04. ON THE TRACK

Multifamily Residence Apartment + Convenience Stores + Bike Facilities
 Location Hirzbrunnen, Basel, Switzerland
 Spring 2015 ETH Basel Studio
 Instructor Jacques Herzog and Pierre De Meuron
 Individual Work

In Switzerland, there's now this semi-urbanism; architecture that's neither good nor bad, neither urban nor rural, where there's always something green, but never lush or a lot...As long as most people can live like that and it doesn't suddenly become too dense and packed in the districts, and in the trams and suburban trains, it's impossible to change it.

- Jacques Herzog

In historical, social, and geological context, Basel, Switzerland is a strategically significant hub connecting Germany, France, and Italy. The site, located at the east border of the city where housing demands are high from artist, international business professionals, and college students, occupies a half abandoned railroad that was once carrying innumerable German cargos on a daily basis. On the Track tackles the housing crisis by re-purposing the abandoned railroad with site specific housing typologies. The master plan integrates the existing tranquil path along the railroad with new community stores tacked in between building complexes connecting residents from the entire district.

- | | | | |
|------|--------------|--|----------------|
| --- | Walking path | | Commercial |
| — | Rail track | | Garden |
| ---- | Main traffic | | Sports |
| | | | Reserved green |
| | | | River |

Site Analysis

With the other railroad alongside the abandoned tracks remains active, On the Track sets to develop three housing typologies for three railroad topography conditions found within the 2 kilometers site to overcome noise pollution. Other design factors include but not limited to solar radiation analysis, natural green spaces per capita, and targeting demographic groups.

Abandoned Railroad - Topography I

Abandoned Railroad - Topography II

Abandoned Railroad - Topography III

Typology I: Micro-Courtyard

Unit Size

110 sq.m. (55 sq.m. x 2)

Height

Two Stories

Key Proposition

Micro-courtyard within each unit

Function

Allowing more natural sunlight into the building

Typology II: Interior Green Filter

Unit Size

135 sq.m. (45 sq.m. x 3)

Height

Three Stories

Key Proposition

Interior green filter facing railroad track

Function

Reducing noise and vibration

Typology III: Solid Shielding Wall

Unit Size

140 sq.m. (35 sq.m. x 4)

Height

Four Stories

Key Proposition

Robust shielding wall with inoperable windows facing railroad track with rooftop garden in each unit

Function

Reducing noise and vibration, maintaining natural greens in each unit

05. BACK OF WOOD

Pavilion Sitting Area + Recycling Facilities + Bike Racks

Location Governors Island, New York, USA

Fall 2015 Iowa State Design Studio 402

Exhibition AIA Iowa Convention 2015

Instructor Jungwoo Ji

Team Shaohua Dong, Yi Zhi Yew

Contribution Conceptual Design, Detail Drawing, Physical Model, Visual Representation, and Writing

Sited in Governors Island, New York, Back of Wood is a contemporary installation constructed solely with prefabricated plywood sheets. The urban furniture adapts ancient interlocking woodwork techniques allowing immediate assembly and disassembly on site without additional connectors. Back of Wood encourages people to linger, perform, explore, and enjoy leisure time in a space that feels inviting. The free standing structure also acts as a recycling center collecting disposable waste people might carry.

Recycling Wall Detail

The bottle profiles define the sectional design of the recycling wall. Plywood planks are chipped to create the slightly angled surface allowing bottle and can to be secured in place with a simple push.

Fabrication Detail

With help of parametric modeling, real-time visualization tools, and large format rapid prototyping CNC bed, the fabrication process of the entire pavilion is set to be completely automated. The double curvature structures are achieved through precisely calculated lock joints.

Recycle Wall

The waffle structure allows people to dispose cans and bottles into its openings. The perforated wall transforms as the day progress. As light penetrates the pavilion and turns into aesthetic shadow, the installation quietly reminds people the potential of up-cycling design.

Sitting Area and Bike Parking

The main sitting area is designed based on ergonomics studies. At the inner side, seats are fabricated at different height welcoming people of all ages to rest on. At the outer site, vertical planks are arranged with calculated space in between so bikes could slip into the gaps and be locked in a secured position.

Interlocking Structure
