[BIO]COMPUTATIONAL DESIGN PROCESS B
Stuttgart, Germany + Tokyo, Japan + Mexico City
Concept - 2016

School: Fakültät für Architektur und Stadtplanung, Universität Stuttgart + University of Tokyo + UNAM.
Advisory: Prof. Achim Menges, Prof. Ehsan Baharlou, Prof. Makoto Sei Watanabe and Dr. en Arq. Ronan Bolanos Linares.
Responsabilities: concept, design, 3D modeling, parametric modelling, scripting, diagrams, plans, renderings, physical and 3D printed model and fabrication.

[BIO]COMPUTATIONAL DESIGN PROCESS A
Stuttgart, Germany + Tokyo, Japan + Mexico City
Concept - 2016

School: Fakültät für Architektur und Stadtplanung, Universität Stuttgart + University of Tokyo + UNAM.
Advisory: Prof. Achim Menges, Prof. Ehsan Baharlou, Prof. Makoto Sei Watanabe and Dr. en Arq. Ronan Bolanos Linares.
Responsabilities: concept, design, 3D modeling, parametric modelling, scripting, diagrams, plans, renderings, physical and 3D printed model and fabrication.

FORSCHUNGSPAVILION 2014 - 15
Stuttgart, Germany
Concept, Design, Fabrication - 2014

School: ICD + ITKE - Fakültät für Architektur und Stadtplanung, Universität Stuttgart
Advisory: Prof. Achim Menges + Prof. Ing. Jan Knippers
Responsabilities: concept, design, programming, parametric design, digital fabrication and presentation.
Credits: Hassan Abbasi, Yassmin Al-Khasawneh, Yuliya Baranovskaya, Marta Besalu, Giulio Brugnaro, Elena Chiridnik, Tobias Grun, Mark Hageman, Matthias Helmreich, Julian Höll, Jessica Jorge, Yohei Kanzaki, Shim Karmin, Georgi Kazlachev, Vangel Kukov, Kantaro Makanae, Amanda Moore, Paul Poinet, Alan Rodriguez Carrillo, Emily Scoones, Andrei Stoiculescu, Kenryo Takahashi and Maria Yablonina

SARAJEVO HOCHHAUS II
Sarajevo, Bosnia and Herzegovina
Architecture Competition (1st place) - 2014

School: Fakültät für Architektur und Stadtplanung, Universität Stuttgart, Germany
Advisory: Professor Dipl.-Ing. José Luis Moro
Responsabilities: Concept design, modeling, diagrams, plans, renderings, physical model and presentation.
Credits: Alan Rodríguez Carrillo

FERROCARRIL CUERNAVACA TRAIN-SCAPES
Mexico City, Mexico
Architecture Competition (Entry) - 2015

Client: Mexico City Government
Firm: Arroyo Solis Agraz Architects
Responsabilities: concept, 3D modeling, renderings, plans and presentation.
Credits: Alan Rodríguez Carrillo, Elmedhi Bellasmine.
Collaboration: Mia Lehrer and Associates

HAIKOU WORMHOLE LIBRARY
Haikou Hainan, China
Facade & Interior Design - Completed

Client: Haikou Tourism & Culture Investment Holding Group
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings, presentations and 3D printed objects.
Credits: Ma Yansong, Dang Qun, Yosuke Hayano, Fu Changrui, Qiang Siyang, Sun Feifei, Dayie Wu, Shang Li, Alan Rodríguez Carrillo, Xie Qilin

JIAXING TRAIN STATION
Jiaxing, China
North Plaza & Interior Design - Completed

Client: Jiaxing modern service industry development & investment (group) co., ltd.
Firm: MAD Architects
Responsabilities: 2D drawing, 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings, presentations and 3D printed objects.
Credits: cao chen, reinier simons, yao ran, fu xiaoyi, yu lin, cheng xiangju, sun mingze, huang zhiyu, zhang kai, li zhengdong, dayie wu, huai wei, claudia hertrich, liu zifan, xie qilin, alan rodríguez carrillo, qiang siyang, etc.

PUERTA REFORMA TOWER
Mexico City, Mexico
Facade Design, Parametric Geometric Control & Construction documentation - Under Construction

Client: Confidential
Firm: Fernando Romero EnterpreisE
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting and 3D printed objects.
Credits: Fernando Romero, Mauricio Ceballos, Unai Artetxe, Liliana Viveros, Luis Vicente Flores Suárez, Alan Rodríguez Carrillo, Eduardo Watanabe, Nicolle Hazard, Luis Vicente Flores Suárez, Libia Castilla.
Collaboration: Thornton Tomasetti and ARUP.

MEXICO'S CITY NEW INTERNATIONAL AIRPORT
Mexico City, Mexico
Facade & Envelope Design, Parametric Geometric Control, Geometric Databases & Construction Documentation - 2018 - Under Construction

Client: Federal Government of Mexico
Firm: Fernando Romero EnterpreisE & Foster and Partners
Responsabilities: 3D modeling, parametric modelling, geometric control, scripting, construction and geometric databases, diagrams, plans, 3D printed objects a.nd Mockups
Credits: FREE, Foster and Patners, Parsons, NACO, ARUP, Thornton Tomasetti, CTVM, CARSO, Trimble, Smart Architecture.

ZHENGZHOU RESIDENTIAL 24 / 25
Beijing, China
Facade Design, Geometry optimization and Smart Clustering adaptation - Completed

Client: Confidential
Firm: MAD Architects
Responsabilities: 2D drawing, 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings and presentations
Credits: MAD Architects

SCIENCE AND TECHNOLOGY MUSEUM
Haikou Hainan, China
Facade & Interior Design - Completed

Client: Hainan Association for Science and Technology
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings, presentations and LDI / CCDI Coordination
Credits: Ma Yansong, Dang Qun, Yosuke Hayano, Kin Li, Fu Changrui, Tiffany Dahlen, Wang Yiding, Reem Mosleh, Sun Feifei, Alan Rodríguez Carrillo, Rozita Kashirtseva, Wu Qiaoling, Edgar Navarrete, Zhu Yuhao, Zheng Chengwen, Zhang Yaohui, Li Hui, Yang Xuebing, Dayie Wu, Zhou Haimeng, Lim Zi Han, Yin Jianfeng.

TENCENT DACHANWAN - COMPETITION
Shenzhen, China
Concept development (1st place) - 2021

Client: Tencent Holdings Ltd.
Responsabilities: 2D drawing, 3D modeling, parametric modelling & geometric control, scripting, charts, diagrams, renderings and presentations.
Credits: MAD Architects

SHANSHUI CITY INNOVATION CENTER - COMPETITION
Shenzhen, China
Concept development & Facade design - 2020

Client: Confidential
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings and presentations.
Credits: MAD Architects & ARUP

ARCHITECTURE PHOTOGRAPHY
Mexico, Germany, Spain, Bosnia and Herzegovina, Italy, Switzerland, South Korea, Tokyo, China and United Arab Emirates

Responsabilities: Physical captures and postproduction
Credits: Alan Rodríguez Carrillo

DGDA GRAND MOSQUE
Riyadh, Saudi Arabia
Architectural & Facade design, BIM, coordination, geometry control and rationalization - Under construction

Client: DGDA
Firm: X - Architects
Responsabilities: Facade coordination & design, 3D modeling, parametric modelling & geometric control, scripting, databases, diagrams, QAQC, BIM, sub-consultants coordination and ACC comunication.
Credits: X-Architects, Werner Sobek, Ramboll, Waho, KCA, Neolight, TNB, DZT, RBA, ZFP, DGJ, KBR, and AQUASHI

TENCENT DACHANWAN PROJECT
Shenzhen, China
Exterior & Interior Facade design & Geometry optimization, Podium rationalization - Completed

Client: Tencent Holdings Ltd.
Firm: MAD Architects
Responsabilities: 2D drawing, 3D modeling, parametric modelling & geometric control, scripting, databases diagrams, renderings, presentations and LDI / SUP Coordination
Credits: MAD Architects, SUP, LDI, WB and Lanscape consultants

LISHUI AIRPORT
Zhejiang Lishui, China
Interior Design & Geometry optimization & Contractor coordination - Completed

Client: Lishui Airport Construction Headquarters
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings and presentations.
Credits: Ma Yansong, Dang Qun, Yosuke Hayano, Liu Huiying, Li Jian, Sun Shouquan, Zhang Xiaomei, Lei Lei, Yang Xuebing, Sun Mingze, Yin Jianfeng, Punnin Sukkasem, Zhu Yuhao, Zhang Yaohui, Alan Rodríguez Carrillo, Pittayapa Suriyapee, Wang Xiny

Jiaxing Cultural & Civic Center
Jiaxing, China
Facade Design & Geometry optimization - Completed

Client: Jiaxing Highway Investment Co. Ltd.
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings and presentations.
Credits: Alessandro fisalli, fu xiaoyi, chen-hsiang chao, he yiming, thoufeeq ahmed, chen hao, he xiaowen, zhang yaohui, guo xuan, edgar navarrete, claudia hertrich, deng wei, zhang xiaomei, chen nianhai, li cunhao, alan rodriguez carrillo, sun feifei, punnin sukkasem, manchi yeung, li yingzhou

e-mail	alanroca05@gmail.com

EDUCATION

2016 - 2017	Master of Science - University of Tokyo - Department of Architecture. Tokyo, Japan.
2011 - 2016	Bachelor of Architecture - School of Architecture - National Autonomous University of Mexico. Mexico.
2014 - 2015	Academic Exchange - Universität Stuttgart - Fakultät für Architektur und Stadtplanung, Germany.
02/05/2015 - 03/01/2015	Academic Exchange - University of Tokyo - Department of Architecture Research. Tokyo, Japan.

ADDITIONAL EDUCATION

2016	Kengo Kuma Laboratory - Department of Architecture. University of Tokyo. Tokyo, Japan.
2015	ICD + ITKE Forschungspavilion 2015 - 2. Universität Stuttgart - Fakultät für Architektur und Stadtplanung. Germany.
2015	ICD + ITKE Forschungspavilion 2015 - 1. Universität Stuttgart - Fakultät für Architektur und Stadtplanung. Germany.
2015	Makoto Sei Watanabe Architect - ALGODEX Experimental Computational Workshop - Tokyo, Japan.
2013	Ayala Studio Workshop - Adyacencias - School of Architecture - UNAM - Mexico City, Mexico / Paris, France.
2012	Cosmic Rays Pavilion Workshop Danish Royal Academy of Fine Arts and UNAM - Mexico / Copenhagen, Denmark.
2011	7th High Technology International Congress of Architecture - School of Architecture - UNAM - Mexico City, Mexico.
2010	6th High Technology International Congress of Architecture - School of Architecture - UNAM - Mexico City, Mexico.

PROFESSIONAL FULL TIME EXPERIENCE

07/05/2024 - 09/05/2025	**X-Architects** - Senior Architect II - Architectural Design, BIM & Sub-consultants coordination, Full-time. Dubai, United Arab Emirates.
03/01/2023 - 30/04/2024	**[NA]rchitects** - Senior Architect I & Consultant - Computational & Design consulting services for architecture, Full-time. Beijing, China.
11/11/2019 - 01/20/2023	**MAD Architects Ltd.** - Intermediate Architect - Architecture Computational Design, Coordination & BIM, Full-time. Beijing, China.
12/2018 - 06/2019	**Fernando Romero EnterprisE** - Junior Architect - Architectural design & BIM, Full-time. Mexico City, Mexico.
02/2017 - 12/2018	**Foster & Partners + Fernando Romero EnterprisE** - Junior Architect - Computational design & BIM, Full-time. Mexico & England.
11/01/2018 - 12/17/2018	**Nikken Sekkei Ltd. + University of Tokyo** - Junior Architect - Software development for architecture, Full-time. Tokyo, Japan.
01/2016 - 03/2016	**BIM Architects** - Junior Architect - BIM architectural design & modelling, Full-time. Mexico City, Mexico.
09/2015 - 12/2015	**Cooperación Comunitaria NGO** - Social Service - Architectural design for disadvantaged communities, Full-time. Guerrero, Mexico.
07/2015 - 09/2015	**Teikoku Databank Ltd.** - Visual Programmer volunter - RESAS prototype Project Tokyo, Full-time. Tokyo, Japan.

CONSULTANCY PART-TIME SERVICES

10/01/2018 - current	**ParametriK Studio S. A. de C. V.** - Founder & Partner - Architecture Design & Consultancy Services, Part-time. Mexico City & Miami, USA.
09/01/2017 - 21/03/2022	**Dezignator** - Computational Designer - Computational visual programming for design & 3D printing, Part-time. Los Angeles, USA.
06/2017 - 07/2019	**ShapeDiver GmbH** - Computational Designer Collaboration - Computational visual online programming, Part-time. Vienna, Austria.
01/28/2017 - 02/01/2017	**Arroyo Solís Agraz Architects** - Architecture Internship - Architecture design and CGI, Part-time. Mexico City, Mexico.
04/2016 - 09/2016	**Nikken Sekkei Ltd. Tokyo** - Architecture Intership - Architectural Design & Documentation, Part-time. Tokyo, Japan.
06/2016 - 09/2016	**Kengo Kuma Laboratory** - Architecture Intership - Architecture Drafting & Documentation, Part-time. Tokyo, Japan.
10/2014 - 05/2015	**Benisch Architekten Stuttgart GmbH** - Architecture student practicant - 3D modeller assistant, Part-time. Stuttgart, Germany.
06/2013 - 11/2013	**Moyao Arquitectos S. A. de C. V.** - Architecture student practicant - 3D Architectural modelling, Part-time. Mexico City, Mexico.
10/2012 - 01/2013	**WEDO** - Architecture student practicant - 3D modeler and render assistant for Architecture, Part-time. Mexico City, Mexico.
07/2009 - 09/2012	**SAT Human Adminsitration & Social Services** - Technical drafter - Architectural technical drafting, Part-time. Mexico City, Mexico.

PROFESSIONAL WORKSHOPS

08/01/2017 - current	**Iberoamerican University** - Online Tutor & Lecturer - Computational Design Professor, Part-time. Mexico City, Mexico.
05/18/2018 - 06/01/2018	**Karlsruher Institut für Technologie** - Speaker - Architektur und Roboter Werkstatt - HAL Robotics, Part-time. Karlsruhe, Germany.
05/22/2017 - 06/05/2017	**UNAM School of Architecture** - 3rd Workshop lecturer - Teaching of Python language in architecture, Part-time. Mexico City, Mexico.
08/07/2016 - 08/12/2016	**Mia Leher & Associates** - Workshop lecturer - Teaching Grasshoper + Python for landscape design, Part-time. Los Angeles, USA.
08/03/2016 - 08/06/2016	**Ingenieros Civiles de Mexicali S. A. de C. V.** - Workshop lecturer - Revit Structural BIM training, Part-time. Baja California, Mexico.
04/2016 - 05/2016	**UNAM School of Architecture** - 2nd Workshop lecturer - Teaching of Python language in architecture, Part-time. Mexico City, Mexico.
06/2012 - 06/2012	**UNAM Institute of Mathematical and Physical Research** - Speaker - Linux for Astronomy Workshop, Part-time. Mexico City, Mexico.

ARCHITECTURE COMPETITIONS

08/2019	**KLAF First Colony on Mars** - International Competition. Kuala Lumpur, Malaysia. [Finalist].
09/2018	**Seduction Pavilion** - International Competition. Bologna, Italy. [Entry].
10/2016	**Cuernavaca Lineal Park** - International Competition. Mexico City, Mexico. [Entry].
03/2015	**Sarajevo Highrise II** - International Competition. Sarajevo, Bosnia and Herzegovina. [1st place].
02/2014	**MEX-USA Border Space Frontier** - International Competition Arquine, Mexico City, Mexico. [Entry].
10/2013	**Pedemonte Museum** - International Students Competititon. Buenos Aires, Argentina. [Entry].
07/2013	**Library + Park** - Architecture Student Competititon. UNAM. Mexico City, Mexico. [1st place].
03/2013	**ATRIUM** - Architecture Student Competititon. Universidad la Salle, Mexico City, Mexico. [Entry].
02/2012	**Capdeville Architecture Competititon** - UNAM Facultad de Arquitectura. Mexico City, Mexico. [2nd place].
09/2011	**ENTRE Forum & 1018 Colective** - Architecture Competition. Universidad Iberoamericana. Mexico City, Mexico. [Entry].

SELECTED ARCHITECTURE WORKS

TRAIN - SCAPES

Cuernavaca, Mexico City. Mexico
Architecture Competition (Entry) - 2015

Client: Mexico City Government
Firm: Arroyo Solis Agraz Architects
Responsabilities: concept, 3D modeling, renderings, plans and presentation.
Credits: Alan Rodríguez Carrillo, El Medhi Beyasmine.
Collaboration: Mia Lehrer and Associates, Los Angeles, USA.

As a ground plane canvas, the landscape throughout the site also serve as a platform to curate programs and experiences, the physical attributes of it would remain consistent bolstering the connection between the site at large including **IDENTITY.**

ENVIRONMENT/SUSTAINABLE PRACTICES - Implement a wide range of natural treatment technologies supporting a new pathway and enhanced visitor experience highlighting biological systems that help purify water in a controlled environment which include bioswales, ponds, land treatment and wetlands.

BIOSWALES/FILTER STRIPS - ALONG ENTIRE LENGTH OF SITE BY PATH Water Filtration, Retention & Detention and Infiltration.

HOLDING PONDS/TREATMENT CELLS - AT LARGER SWATHS OF LANDS throughout site can include sports fields and meadows for the productive landscape.

CONSTRUCTED & FLOATING WETLANDS - PRODUCTIVE LANDSCAPE:

These are designed to take advantage of many of the same processes that occur in nature, but do so within a more controlled environment. Floating wetlands enhance contaminant removal processes while cover provided by the floating structure promotes conditions conducive to settling.

FERROCARRIL DE CUERNAVACA TRAIN-SCAPES

DYNAMIC LANDSCAPE

The line will be an educational path, a way to confront people with new ways of living the city.

People will be trained on urban agriculture, make them conscious of the water systems and general environment.

The motion in society, development and change is certain to be a part of the environment for some time to come creating adaptable, modular, multi-benefit places that can be configured in different ways over the space.

What better to reflect this then the connection to train to site, the physicality of tracks building in identity for the entire path.

The ability to adapt to signals of change from people's needs, external environment and weather, creating social resilience.

The ability to experiment with a lot of configurations in different locations.

CULTURAL LANDSCAPE

Landscape that reveals aspects of Mexico City´s origins and development through the features and the ways they are used - the integration of arts and cultural resources with civic programs = museums, art and sculpture gardens.

Places to learn, gather, educate about local cultural practices and identity of neighborhood, city and country.

This linear landscape can enhance the transitions between indoor and outdoor exhibitions by creating a reciprocal foreground and background to frame art spaces.

Areas could also host exhibits of the many complex and interdependent cultural manifestations of native customs, spiritual practices, oral traditions and festivities.

PRODUCTIVE LANDSCAPE

Creating agricultural fields, garden plots, groves, building on history of floating chinampas.

More efficient land use, allowing food production while sparing land for wild nature - increasing biodiversity.

Food security - providing food for local neighborhoods.

Many benefits to a community, including closer neighborhood ties, reduced crime, education and job and health opportunities.

COMMUNITY LANDSCAPE

Balancing of the nature of past, present, and future social values.

Bolstering the community through programming and engagement; creating profound impact - can building social networks, encouraging new leaders, increasing the quality of life, connecting people to nature and increasing the overall vibrancy.

Outdoor classrooms, botanical gardens and nature walk.

Places for civic and social interaction including community boards, platforms, plazas, squares, lending libraries, farmers markets, botanical gardens, outdoor classrooms, participatory art-making, informal activities such as food in the street markets.

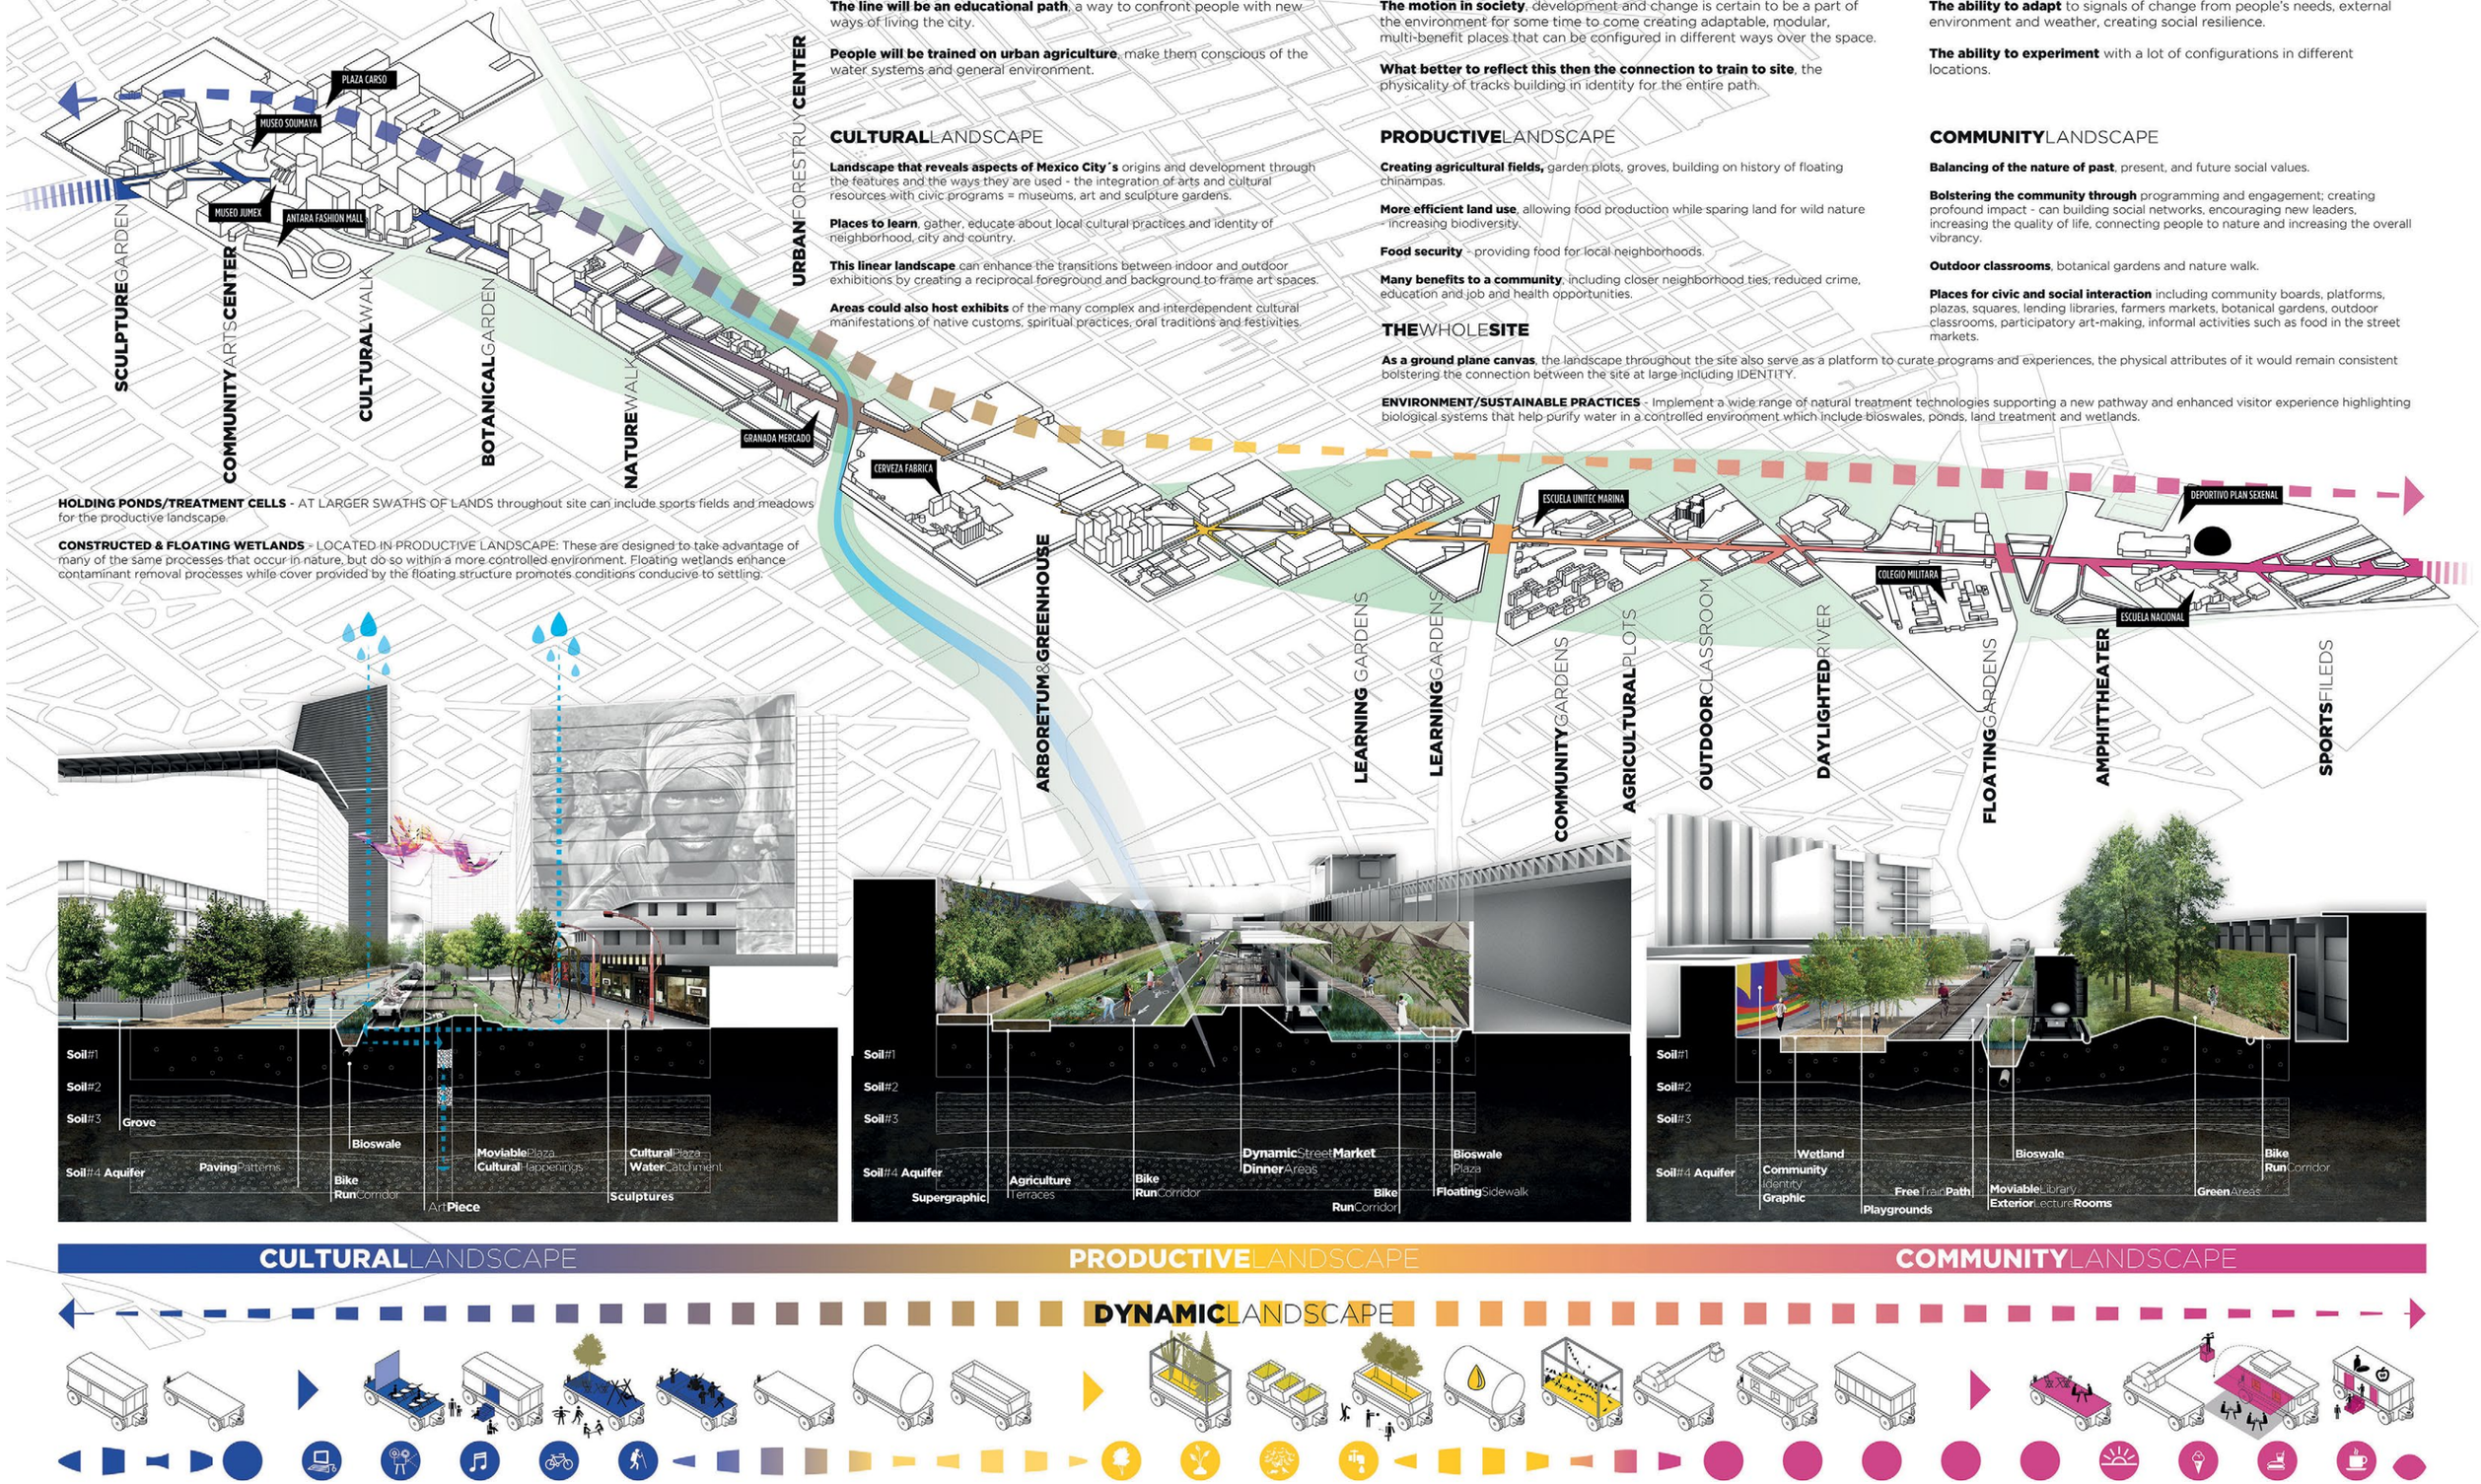
THE WHOLE SITE

As a ground plane canvas, the landscape throughout the site also serve as a platform to curate programs and experiences, the physical attributes of it would remain consistent bolstering the connection between the site at large including IDENTITY.

ENVIRONMENT/SUSTAINABLE PRACTICES - Implement a wide range of natural treatment technologies supporting a new pathway and enhanced visitor experience highlighting biological systems that help purify water in a controlled environment which include bioswales, ponds, land treatment and wetlands.

HOLDING PONDS/TREATMENT CELLS - AT LARGER SWATHS OF LANDS throughout site can include sports fields and meadows for the productive landscape.

CONSTRUCTED & FLOATING WETLANDS - LOCATED IN PRODUCTIVE LANDSCAPE: These are designed to take advantage of many of the same processes that occur in nature, but do so within a more controlled environment. Floating wetlands enhance contaminant removal processes while cover provided by the floating structure promotes conditions conducive to settling.



CULTURAL LANDSCAPE — PRODUCTIVE LANDSCAPE — COMMUNITY LANDSCAPE

The unprecedented population growth of the cities around the world requires the sustained increase of urban density. Over the past century the pressure from population growth was relieved with the vertical expansion of the city. The constant increase of building heights has pushes today's skyscrapers to a point where less and less value is found in height alone. To fulfill the population demands of tomorrow, growth in building density will be forced to expand in all axes [X+Y+Z].

Situated above the existing urban fabric, this building occupies the space between Smaja od Bosne street and Vrbanja streeth in Sarajevo City, the capital of Bosnia and Herzegovina. The size of the structure creates an interdependecy and allows for the formation of new high communities within the already low-medium dense housing grid. Woven into the residential, govermental and commercial fabric of the grid. Large office tower provide a workplace for the residents of the structure.

These two-one tower unfold to allow for a large public park cut high bottom to the city, mantaining the necessary public access to nature. Far removed from the intensity of urban life, the park provides residents and visitors and scape to nature while still maintaining a unique visual link with the city. The building is interconnected with tha main streets of the city and the main river. The collection of these parts reaches a critical mass allowing the structures to exist as an autonomous entity within the city, a new building prototype for the Sarajevo City.

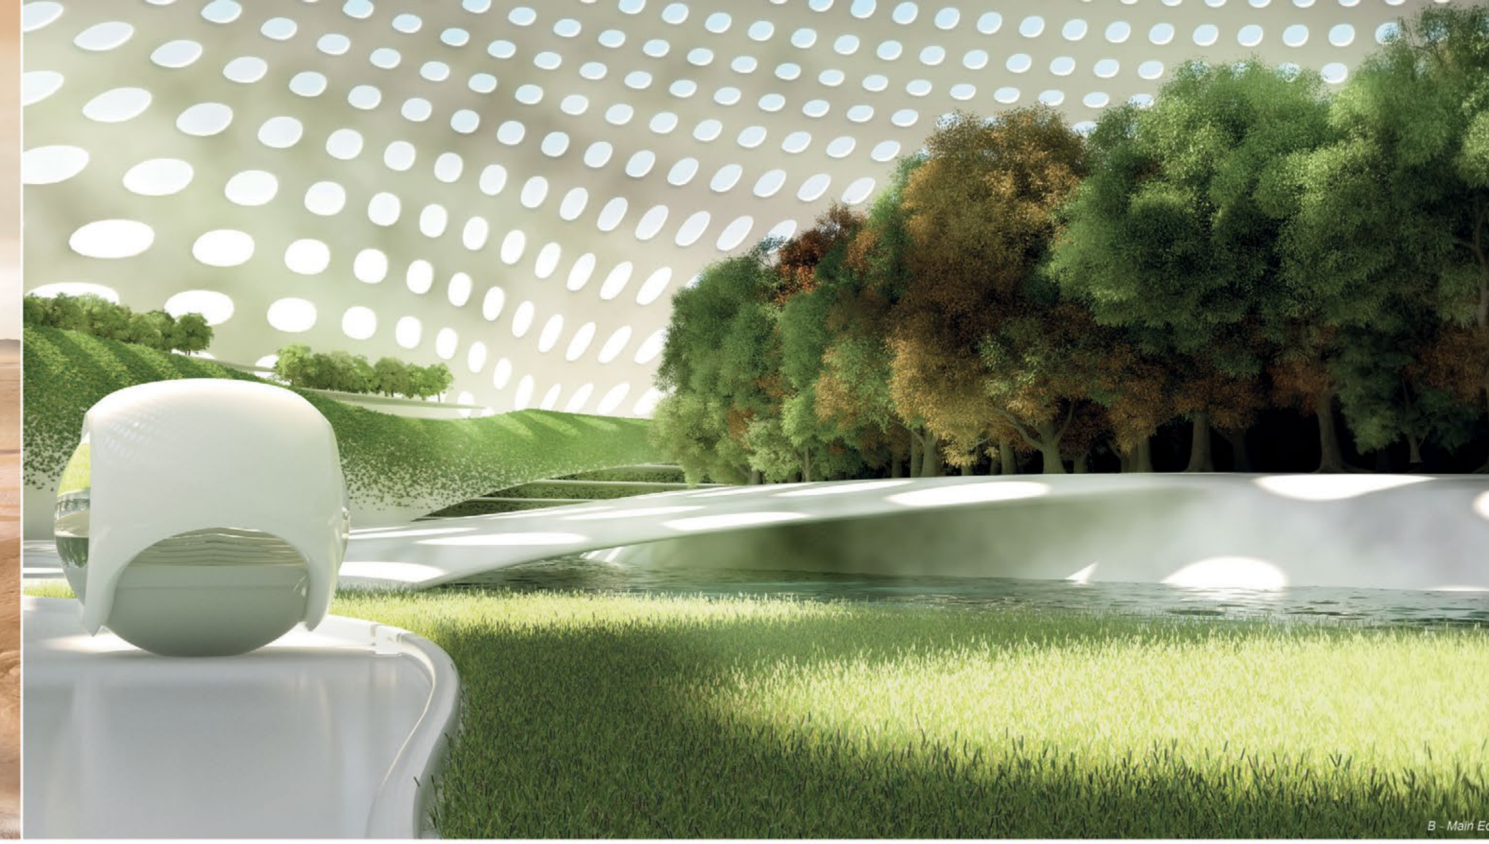
FIRST HUMAN MARS COLONY

Kuala Lumpur, Malaysia
Architecture Competition - Finalist - 2015

Client: KLAF Architecture International Competition
Firm: ParametriK Studio S. A. C. V.
Responsabilities: Concept, 3D modeling, renderings, plans and presentation.
Credits: Alan Rodríguez Carrillo, Guillermo Rage Musi and Roberto Athie.

A - Mars Eden



B - Main Eden

Mars Eden

First outter space human colony

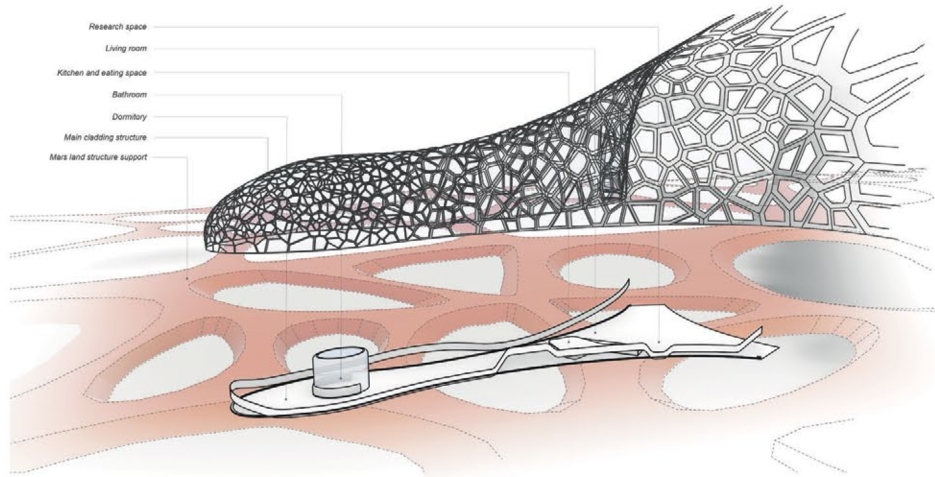
Mars Eden was conceptualized from a hexagon because it gives a sequence provided for an ordered and controlled growth from the requested premise of the number of initial inhabitants for the colony. In each of its final vertices, a living and research space was proposed for a couple where these houses share, respond and have access to the main core, the hexagon.

For the modulation distance, the area and the size of these hexagons the proportion of the so-called "metallic numbers" was used. The use of this proportion with the hexagonal geometry allowed us to generate an expansion of the colony in a sequential, orderly and above all functional way. The expansion consists in that the first hexagonal core can join and respond to a larger core and that from its vertices more colonies are annexed and at the moment of following the expansion that "primary" core becomes "secondary" giving entrance to a much larger one thus generating an entire expansion system. As such, speaking of hard data, the system consists of the main nucleus that branches into five secondary nuclei and in each of these five, there are branched out five living clusters, wherein each of these going to host a couple of people, resulting in a colony of fifty people.

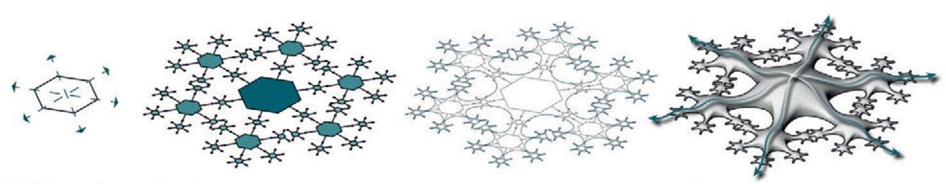
A general geometry was proposed, based on the hexagonal grid, to be conceptualized as a whole. Through this, the result obtained was a fluid and elastic geometry thinking as a primary structure that branches off. For its construction, it is thought to send a ship that contains spherical drones that at the moment of arriving at the *Elysium Planitia*, they settle in strategic places and at the moment they reach their location robotic arms comes out from the inside and start to build the main structure of the proposed geometry with the help of other smaller drones, using the land of Mars and a liquid polymer brought from the Earth as material.

At the boundaries of the geometry the living clusters are located, where each one has basic services, food preparation, and research area; continuing to the center is the nucleus where the living clusters converge, and their use is designated for the cultivation and processing of food. Already as part of the expansion, the next nucleus that will become a larger green area that works by generating oxygen and has control points for transportation. At the center, a larger nucleus is proposed, the main Eden, where apart from being a green lung for the whole system, it has all the services for public use such as libraries, schools, health centers, main headquarters, and transport centers, as well as areas for leisure, entertainment, and exercise. Also, this Eden, thinking for the future, has the characteristic to be able to function as an element that can be connected to other future colonies to give rise to the first city on Mars.

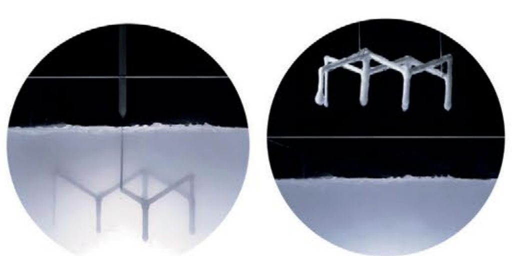
A new transportation system is proposed and consists of spherical glass capsules where its external glass can rotate, moving without affecting their interior, and likewise the interior can rotate in its own vertical axis without affecting the displacement of the capsule. The movement of the capsules within the system is a radial route that covers all the geometry and has control stations allowing entrance and exit of the main system. A space exploration and researching center was also proposed because the capsules have the characteristics to leave the system and travel outside the red planet for research purposes, however, as a safety measure, each of the capsules have in their back with health team in case of human health emergencies and safety tools for natural disasters events.



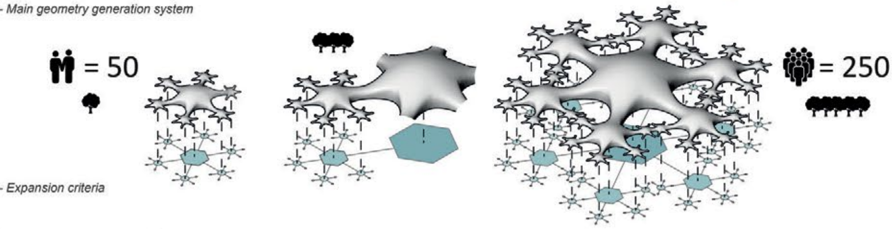
01 - Building station components



02 - Main geometry generation system



Inside liquid 3D print generation
Outside final 3D print generation



03 - Expansion criteria

The short-term plan is to have a core oxygen generator, where five secondary cores store and generate food, are annexed into it, and from the secondary nuclei five living spaces are branched out for the first fifty people. At the same time of completing the short-term objectives, the drones will continue building the next phase of the system to make way for a larger core, which would be the medium-term goal, where this new core is an oxygen generator and transport points are implemented throughout the system because the scale of this is increasing, all with the aim of continuing the expansion. As a long-term goal we have the next phase of expansion, which would be the core of Eden, where all public services are located, and generate a city environment with a large green lung that generates oxygen for the entire system and with the characteristic that this nuclei can join in the future to other colonies for an expansion.

The architectural aesthetics and constructive methods of this system allows to generate a pleasant, fluid, comfortable and above all functional space, where each core of the system has its own characteristics and generates its own environment but always in correlation and coexistence with other nuclei, all responding and working together generating an orderly and sequential system to achieve the future of a large city on Mars.

It is difficult to imagine how a whole habitable system could be generated for the human being on another planet, not having a historical record of this, however the way to carry this out is to propose, thinking out of the box about the next step for humanity, a concept becoming reality, without losing sight of the fact that this initiative to live off Earth is getting closer and closer to what we expect. Let's be prepared for the unknown…

FORSCHUNGSPAVILION 2014 - 15

Stuttgart, Germany
Concept & Design Development and Fabrication - 2014

School: ICD + ITKE - Fakültät für Architektur und Stadtplanung, Universität Stuttgart
Advisory: Prof. Achim Menges + Prof. Ing. Jan Knippers
Responsabilities: concept, design, scripting, geometry control, digital fabrication and presentation.
Credits: Hassan Abbasi, Yassmin Al-Khasawneh, Yuliya Baranovskaya, Marta Besalu, Giulio Brugnaro, Elena Chiridnik, Tobias Grun, Mark Hageman, Matthias Helmreich, Julian Holl, Jessica Jorge, Yohei Kanzaki, Shim Karmin, Georgi Kazlachev, Vangel Kukov, David Leon, Kantaro Makanae, Amanda Moore, Paul Poinet, Alan Rodríguez, Emily Scoones, Djordje Stanojevic, Andrei Stoiculescu, Kenryo Takahashi and Maria Yablonina.

The ICD/ITKE Research Pavilion 2014-15 demonstrates the architectural potential of a novel building method inspired by the underwater nest construction of the water spider. Through a novel robotic fabrication process an initially flexible pneumatic formwork is gradually stiffened by reinforcing it with carbon fibers from the inside. The resulting lightweight fiber composite shell forms a pavilion with unique architectural qualities, while at the same time being a highly material-efficient structure.

The Institute for Computational Design (ICD) and the Institute of Building Structures and Structural Design (ITKE) continue their series of research pavilions with the new ICD/ITKE Research Pavilion 2014-15 at the University of Stuttgart. These building prototypes explore application potentials of novel computational design, simulation and fabrication processes in architecture. The pavilion was developed at the intersection of the two institute's research fields and their collaborative teaching in the context of the interdisciplinary and international ITECH MSc program. This prototypical project is the result of one and a half years of development by researchers and students of architecture, engineering and natural sciences.

The design concept is based on the study of biological construction processes for fiber-reinforced structures. These processes are relevant for applications in architecture, as they do not require complex formwork and are capable of adapting to the varying demands of the individual constructions. The biological processes form customized fiber-reinforced structures in a highly material-effective and functionally integrated way. In this respect the web building process of the diving bell water spider, (Agyroneda Aquatica) proved to be of particular interest. Thus the web construction process of water spiders was examined and the underlying behavioral patterns and design rules were analyzed, abstracted and transferred into a technological fabrication process.

The water spider spends most of its life under water, for which it constructs a reinforced air bubble to survive. First, the spider builds a horizontal sheet web, under which the air bubble is placed. In a further step the air bubble is sequentially reinforced by laying a hierarchical arrangement of fibers from within. The result is a stable construct that can withstand mechanical stresses, such as changing water currents, to provide a safe and stable habitat for the spider. This natural production process shows how adaptive fabrication strategies can be utilized to create efficient fiber-reinforced structures.

For the transfer of this biological formation sequence into a building construction application, a process was developed in which an industrial robot is placed within an air supported membrane envelope made of ETFE. This inflated soft shell is initially supported by air pressure, though, by robotically reinforcing the inside with carbon fiber, it is gradually stiffened into a self-supporting monocoque structure. The carbon fibers are only selectively applied where they are required for structural reinforcement, and the pneumatic formwork is simultaneously used as a functionally integrated building skin. This results in a resource efficient construction process.

The prototypical character of the fabrication process required the development of a custom made robot tool that allows placement of carbon fibers based on integrated sensor data. The technical development of this tool became an integral part of the architectural design process. This process also posed special challenges for the material system. ETFE was identified as a suitable material for the pneumatic formwork and integrated building envelope, since it is a durable facade material and its mechanical properties minimize plastic deformation during the fiber placement. A high degree of functional integration is achieved through the use of the ETFE film as pneumatic formwork and building envelope. This saves the material consumption of conventional formwork techniques as well as an additional façade installation. A composite adhesive provided a proper bond between the ETFE film and the carbon fibers. During production nine pre-impregnated carbon fiber rovings are placed in parallel. 45km of carbon roving were laid at an average speed of 0.6 m min on 5km of robot path. This additive process not only allows stress-oriented placement of the fiber composite material, but it also minimizes the construction waste associated with typically subtractive construction processes. The ICD / ITKE Research Pavilion 2014-15 covers an area of about 40m² and an internal volume of approximately 130m³ with a span of 7.5m and a height of 4.1m. The total construction weight is just 260kg, which corresponds to a weight of 6.5kg / m².

The ICD / ITKE Research Pavilion 2014-15 serves as a demonstrator for advanced computational design, simulation and manufacturing techniques and shows the innovative potential of interdisciplinary research and teaching. The prototypical building articulates the anisotropic character of the fiber composite material as an architectural quality and reflects the underlying processes in a novel texture and structure. The result is not only a particularly material-effective construction, but also an innovative and expressive architectural demonstrator.

The research for the ICD/ITKE Research Pavilion 2014 – 151 extended the brecomposite processes of the 2012 and 2013 – 14 pavilions through the integration of a weatherproof skin based on a biological investigation of the diving bell water spider (Argyroneta aquatica). Contrary to the insights on morphological principles for brous structures gained from the biological role models used for the previous two pavilions, the water spider investigation focused on the process-based biomimetics utilised in the construction of its subaquatic nest.

How can we achieve the computational simulation of matter and energy, linked to the production of form, without first making the form itself?

This is the generative design scheme, which contemplates the computational, mathematical, biological and physical simulation stages, with the aim of imitating and representing through a graphic programming algorithm and geometry, a branched natural fractal growth system, from the physiological and behavioral analogy of a coral of the genus Acropora.

This formal system of flows, was generated from the incorporation of the "Agent-based modeling", a type of approach to architectural design contemporary that implies concepts of integration and final geometric materialization of The relationship of entities. The main aspect, however, was to link to each of these individual entities in a system capable of providing a generation-based synthesis in the way as a consequence and in response to qualitative external variables through quantitative control variables.

The research developed from this method can allow constant feedback, integration and model building complexes in a particular computational design process, by allowing to

In response to the needs of the largest infrastructure development in Latin America, the collaborative team designed Mexico's New International Airport Terminal with the aim to revolutionize airport design and the experience of traveling. Upon the completion, the building and infrastructure will not only perform for the duration of the 21st Century, but also evolve into an icon for Mexico.

The “Airport of the Future” is designed with inspiration from the past; the shape, the symbolism, the shear monumentality of the building are all drawn from Mexican art and architecture. Designed to be the most sustainable airport in the world, the first with the LEED certification, the single terminal is being strategized to minimize costs and maximize experience.

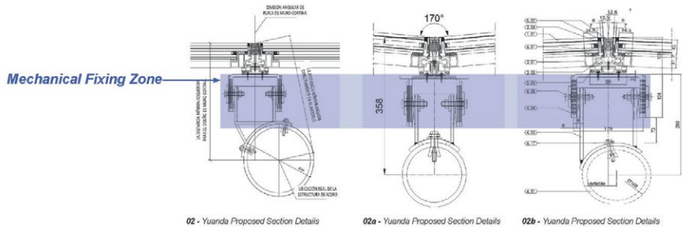
PROBLEM 1: MECHANICAL FIXING ZONE INCREASES REQUIRED DISTANCE BETWEEN STRUCTURAL & CLADDING CENTERLINES.

PROBLEM 2: INCREASED DISTANCE BETWEEN STRUCTURAL & CLADDING CENTERLINES INCREASES THEIR RELATIVE MISALIGNMENT.

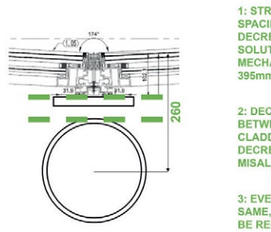
PROBLEM 3: BECAUSE OF THIS MISALIGNMENT, THE DESIGN & CONSTRUCTION OF EACH STRUCTURAL BRACKET WILL BE UNIQUE & REQUIRE A FIELD-SURVEY OF THE AS-BUILT STRUCTURE.

A - Main cladding on structure mounting system - Proposed by contractor



B - Mechanical 2D details proposed

SOLUTION

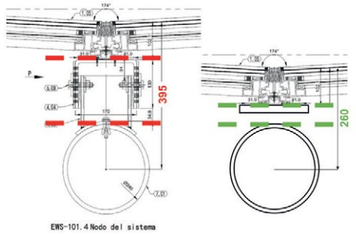


1: STRUCTURAL TO CLADDING SPACING DRASTICALLY DECREASED WITH THIS SOLUTION BY REMOVING MECHANICAL FIXING ZONE – 395mm TO 260mm

2: DECREASED DISTANCE BETWEEN STRUCTURAL & CLADDING CENTERLINES DECREASES THEIR RELATIVE MISALIGNMENT.

3: EVERY SHIM WILL BE THE SAME, NO FIELD SURVEY WILL BE REQUIRED.

C - Proposed Shim support - 2D Drawing



1: STRUCTURAL TO CLADDING SPACING DRASTICALLY DECREASED WITH THIS SOLUTION BY REMOVING MECHANICAL FIXING ZONE – 395mm TO 260mm

2: DECREASED DISTANCE BETWEEN STRUCTURAL & CLADDING CENTERLINES DECREASES THEIR RELATIVE MISALIGNMENT.

3: EVERY SHIM WILL BE THE SAME, NO FIELD SURVEY WILL BE REQUIRED.

D - Proposed Shim support solution - 2D Drawing

PRECAUTION

PUERTA REFORMA TOWER

Mexico City. Mexico

Facade Design, Parametric Geometric Control & Construction documentation - SD, DD - Under Construction

Client: Confidential
Firm: Fernando Romero EnterpreisE
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, plans and 3D printed objects.
Credits: Fernando Romero, Mauricio Ceballos, Unai Artetxe, Liliana Viveros, Alan Rodríguez Carrillo, Eduardo Watanabe, Nicolle Hazard, Luis Vicente Flores Suárez, Libia Castilla.

Torre Puerta Reforma will be a skyscraper located on Avenida Mariano Escobedo and Melchor Ocampo, Colonia Nueva Anzures, in Miguel Hidalgo Delegation in Mexico City. It will have 18 high speed elevators (elevators) that will move at 6.6 meters per second. To be exact, it will become the tallest and most modern skyscraper in Mexico City. In addition, it will seek to become the tallest in Latin America, with a height of 335 meters.

The design will be carried out by Fernando Romero, and the property on which this tower will be built is owned by Carlos Slim. Since 2008, a tower that is iconic for the landscape of Mexico City has been planned. That is why this tower has gone through several designs and has been increasing its height. It is worth mentioning that its importance also lies in the fact that Torre Puerta Reforma will be the connection between Paseo de la Reforma and Polanco. Until now a building has been demolished, land that will occupy the new tower, and in February 2017 the parking lot that operated on this property was vacated.

The complex will include a restaurant, a shopping center and entertainment areas. The construction company will be 'Grupo Xtra´.

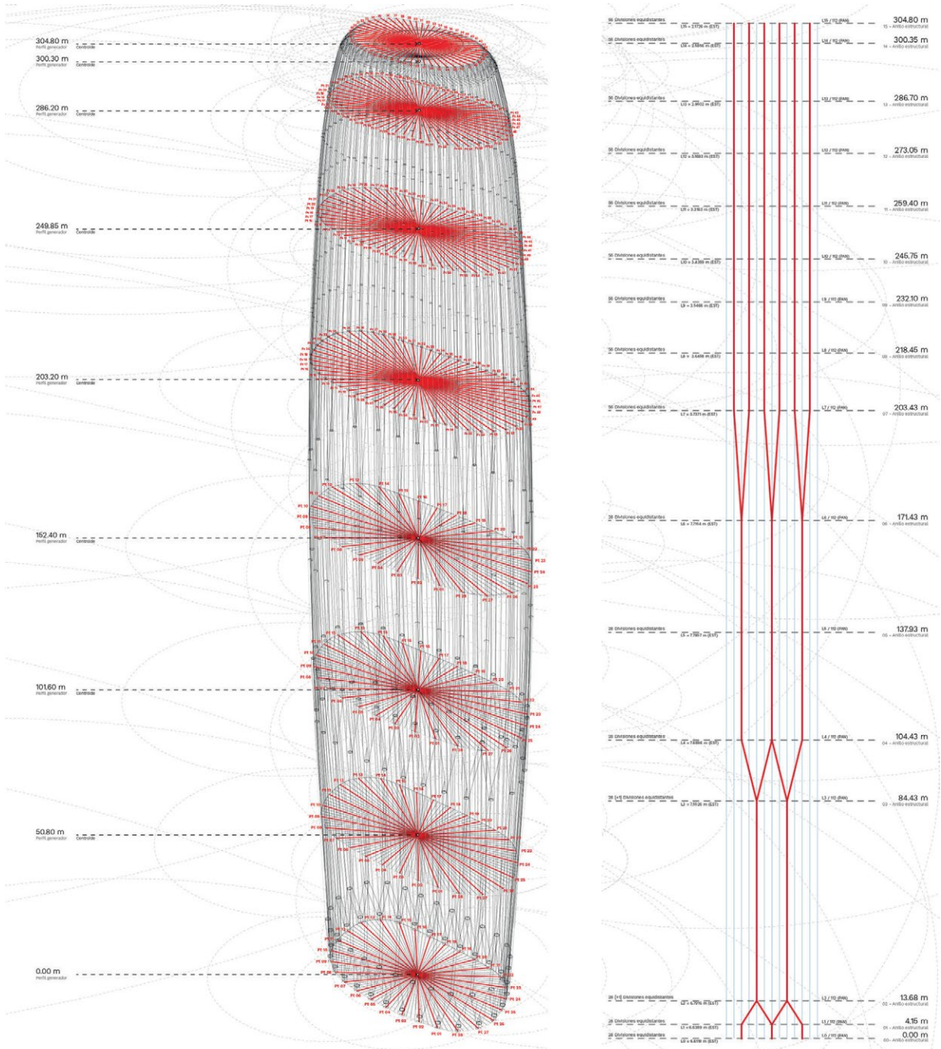
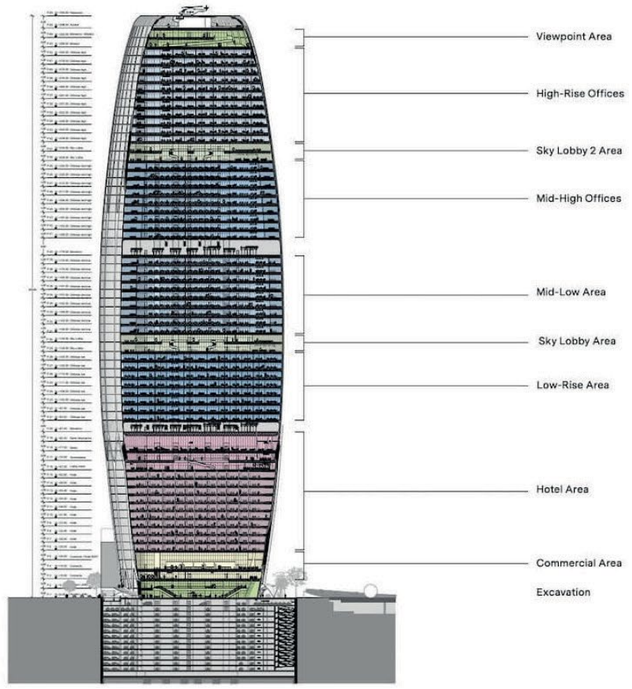
Initial parametric transformation, rationalization and geometric optimization

Geometry and data transformation from Autodesk Maya using Rhinoceros + Grasshopper + Visual + Python script

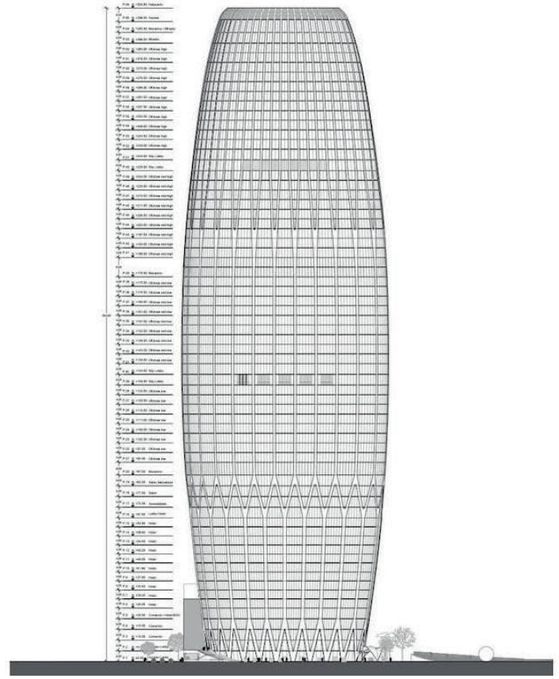


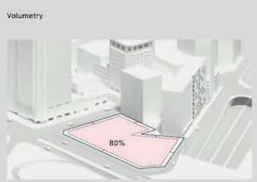
A - Form + Cladding + Structure parametric rationalization diagram.

Building Section



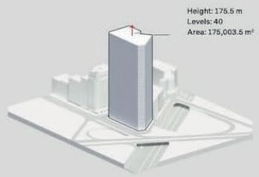
Building Facade





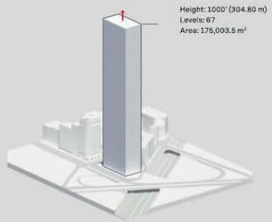
1 — Building Shift

Building footprint shifts slightly inwards from the property line.
Property Area: 5,468.86 m²
Maximum Offset Area: 4,375.08 m²



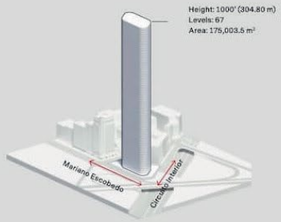
2 — Constructible Area

Constructible area is maximized with the building's first extrusion at forty levels.



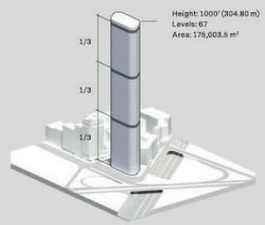
3 — Tower Height

Concept maximizes building height to differentiate itself from nearby towers on Reforma Avenue and become a landmark on the skyline.



4 — Plan Geometry

Building footprint is adapted to the site's geometry, becoming rhomboidal in plan and establishing a dialogue with the road axes converging at Paseo de la Reforma, Circuito Interior and Calz. Gral. Mariano Escobedo.

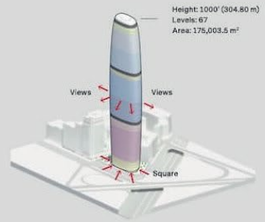


5 — Division into Three Zones

Tower is divided into three zones housing the mechanical plants as well as structural elements to alleviate horizontal stresses, an extremely efficient division for the installations as well as safeguarding against seismic events and gale-force winds.

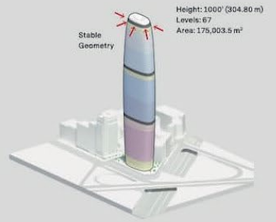
6 — Program

Program adapts well to the building's three zones, allowing for ideal placement of the lobby, commercial, hotel and amenities in the first zone, as well as four office typologies plus an observatory in the two upper zones.



7 — Silhouette of the Tower

Tower's base narrows at the ground plane to create a public plaza while the building's central area widens to maximize office floor plates, views, and profit.



8 — Earthquake Stability

Tower's top also narrows to optimize structural systems and provide maximum stability during seismic events.

JIAXING TRAIN STATION

Jiaxing, China
North Plaza & Interior Terminal North Design / DD + CD
2018 - 2022
Completed

Client: Jiaxing modern service industry development & investment (group) co., ltd.
Firm: MAD Architects
Responsabilities: 2D drawing, 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings, presentations and 3D printed objects.
Credits: cao chen, reinier simons, yao ran, fu xiaoyi, yu lin, chen wei, he shunpeng, cheng xiangju, kaushik raghuraman, chen nianhai, deng wei, cao xi, sun mingze, huang zhiyu, zhang kai, li zhengdong, dayie wu, huai wei, claudia hertrich, liu zifan, xie qilin, alan rodriguez carrillo, qiang siyang, hou jinghui, li xinyun, yin jianfeng, mathias juul frost, lei lei, lu zihao.

The train station is situated in the center of Jiaxing, an interconnected city in southeast China close to Shanghai, Hangzhou, and Suzhou. A key city for several major industries, Jiaxing is referred to as the "home of silk" and the "land of milk and honey." In 1921, the First Party Congress of the Communist Party of China was held in Jiaxing, which led to the founding of the Party.

The project brief covers an area of 35.4 hectares, encompassing Jiaxing Train Station, the plazas to the north and south, and a renovation of the adjacent People's Park. Before the renovation, the existing station had reached its maximum capacity. In addition, the disorder of the surrounding transportation system and a deficient supporting infrastructure had led to a decline in the area surrounding the station.

Drawing inspiration from Jiaxing's historic and cultural contexts, MAD's proposal includes a 1:1 rebuilding of the historic station building derived from archival studies, while creating a new train station underground. The new station will be bright, efficient, and human-scaled, with a flood of natural light to create a friendly, comfortable environment. The main transportation and commercial functions are to be located in the basement level, allowing the ground-floor space to be given back to nature. A shared space between Jiaxing's citizens and travelers, this new green urban center will transform into a "train station in the forest."

MAD's proposal places the busy transportation junction underground, freeing the ground floor of obtrusive infrastructure, thus allowing the People's Park to radiate through the scheme into the city, and form an urban oasis. A careful consideration to landscape and massing has formed an axis with the reconstructed old station building at its core. In front of the station, a large collection of canopy shaped trees have been planted, creating comfortable, natural shades for the plaza.

Looking south along the central axis, the rebuilt station building and the "floating" metal roof of the new station will blend with the forest trees. The station concourse, platforms, and waiting hall are hidden underground, while the building's single-story height above ground level humbly respects the scale of the old station building.

An abundance of natural light floods into the underground waiting hall through skylights and glass curtain walls on the ground floor, creating a subterranean space which is both open and bright. The internal atmosphere and tone are centered on the human scale, with the aim of creating a pleasant, comfortable experience for travelers. As people move from the waiting hall to the platforms via a futuristic underground tunnel, they observe the rebuilt old station building overhead. Here, a moment is created where old meets new, and a sharp yet composed contrast is showcased between the past and future.

MAD's scheme also places the station's commercial functions underground, linking the train station with the city's transportation hub. In addition, sunken courtyards connect the underground commercial space with the parkland above. To the south of the station, a new above-ground commercial area is created, enclosed by landscaped public lawns that can host a variety of events, festivals, concerts, or markets.

Through careful transportation planning and vertical use of the space, MAD's scheme accommodates the existing passenger demands for the station, while also allowing for future sustainable development and expansion. The scheme's emphasis on connecting with its surroundings will also serve to increase human activity and visitors to the area, enhance its commercial offering, and ultimately rejuvenate the old city center with a new vitality.

WORMHOLE LIBRARY

Haikou Hainan, China
Facade & Interior Design / DD + CD
2019 - 2021
Completed

Client: Haikou Tourism & Culture Investment Holding Group
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings, presentations and 3D printed objects.
Credits: Ma Yansong, Dang Qun, Yosuke Hayano, Fu Changrui, Qiang Siyang, Sun Feifei, Dayie Wu, Shang Li, Alan Rodríguez Carrillo, Xie Qilin

The sensuously curved pavilion appears to be a “wormhole” that transcends time and space. It serves as a multi-functional building that allows visitors to read, enjoy views of the sea, and attend open-air performances, temporarily removing themselves from the hustle and bustle of everyday life. The building is now under construction and will be completed in 2021.

Located in southeast China, Haikou is the capital of Hainan province. It once served as an important port along the Maritime Silk Road, and today has become a key area of the Hainan free-trade island initiative.
In 2019, the local government launched the Haikou Bay rejuvenation plan in an effort to enhance the use of public space along the Haikou coastline. A series of pavilions by both domestic and international architects is under planning and the Wormhole Library will be the first one to be completed.

Facing the South China Sea, the Wormhole Library is located in Century Park along the Haikou Bay coastline. The intimately scaled structure is cast of white concrete as a unit. The curved concrete walls not only serve as organic architectural structure, but also connect the ceiling, the ground and the walls together. Holes of varying sizes allow the architecture to breathe and meanwhile let natural light flood the interior. The grey spaces of the exterior corridors provide shady spots for passers-by to stop and rest.

The interior is composed of two parts: a 690-square-meter (7,430-square-foot) reading space that can store approximately 10,000 books, a café and a terrace; and a 300-square-meter (3,230-square-foot) public rest area that is equipped with a bicycle parking system, public bathrooms, and shower areas.

To ensure accuracy and seamlessness across the curved surfaces, the building is being cast using both a CNC and 3D printed model. All MEP has been designed to be hidden within the concrete cavity to minimize its appearance and create visual consistency. Curved sliding doors and retractable glass curtain walls not only provide views of the sea, but also enhance overall airflow and ventilation. In response to local weather conditions, the roof on the sunny side is cantilevered to achieve comfortable temperatures, realizing a sustainable and energy-saving building.

SHANSHUI CITY INNOVATION CENTER

Shenzhen, China
Concept development & Tower Facade design / SD
2020
Competition

Client: Confidential
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings and presentations.
Credits: MAD Architects & ARUP

The project site is in an important ecological and landscape environment. It is backed by the Central District of Futian and directly faces the landscape of Hong Kong. It is a natural intersection of city and landscape. All these provide the environmental basis for creating a unique Shanshui city.
As China's youngest landmark City, Shenzhen has a multi-cultural convergence, the spirit of the city is inclusive and enterprising, full of innovative power. Therefore, it is of great significance to upgrade the relationship between city and nature from adaptation and coordination to integration, so as to realize a park like future innovation park with high technology and sustainable development in the world. Its high standard and foresight make it very important.

In the painting of Fuchun Shanju, the magnificent scenery flowing is constantly unfolding. However, this is not a realistic Fuchun River landscape painting, but a combination of the ideal shanshui in the painter's mind, which realizes the resonance between people and nature.
[illegible] and memory enable people to have a natural feeling of resonance with the ideal shanshui without deliberate study. The further development of resonance is the sense of belonging, and the link between them is artistic conception and emotion.

Today, cities are facing the same challenges, rapid development and how to maintain a good environment. The elements of an ideal city are defined by rational analysis. However, such a city with the principle of unity is still difficult to bring a sense of belonging to people. What is missing is the emotion and resonance point of the people in this region. Looking for them is the essence of a Shanshui city.

The goal of the design is to upgrade the relationship between city and nature from adaptation, coordination and integration to the realm of Shanshui city. The second goal is to realize the park oriented future science and technology innovation center. It's high standard and forward-looking make it have an unusual new concept all over the world.

The planning mixed use of plots is conducive to the mutual supplement of functions. Huanggang port is a comprehensive urban area with the port as the center to realize the composite utilization of spatial functions, perfect urban functions and Integrated Station City. Science and technology innovation park takes the park environment as the ecological prospect of the rear comprehensive urban area, fully demonstrating the beautiful blend of city and nature.

Creating a park environment in the science and technology innovation park is an ecological compensation for construction activities, and provides a green ecological prospect for the city. It is also the basis for building the future science and technology innovation park.
Put all the traffic underground to make the ground a park, so that more space can be released to serve people and provide a good environment for ecological travel.

From the city to the Shenzhen River, the wave shape is gradually reduced, and three green corridors are added. Multi level in the building, multi-level three-dimensional greening, so that the building fully integrated in the park landscape.

The new Huanggang port building is a highly complex transportation hub, which brings a lot of people to this area. With the port as the center of the surrounding buildings, several pieces of land are woven into an interconnected comprehensive area by means of three-dimensional interconnection. Form a three-dimensional city including office, hotel, residential, retail and cultural functions. Efficient, natural and artistic, all of which make it an outstanding urban environment.

TENCENT DACHANWAN

Shenzhen, China
Concept development & Towers and Cloud Facade Design / SD + DD
2020 - 2025
Competition entry - (1st place)

Client: Confidential
Firm: MAD Architects
Responsabilities: 2D drawing, 3D modeling, parametric modelling & geometric control, scripting, charts, diagrams, renderings and presentations.

As the most cutting-edge leader in the global Internet industry, Tencent regards talent and technological innovation as its important assets.

Tencent's business model that connects you and me and is full of social responsibility meets everyone's needs. And accompany family, friends, and colleagues to experience all aspects of the digital age.

User value constitutes Tencent's corporate philosophy. It has also become the next important strategic plan for Tencencent. The core demand for the environment of Shenzhen Dachan Bay area improve the comprehensive service functions of the entire city from the urban scale to provide individuals with inclusive and vibrant work, leisure and living spaces the entire vibrant new urban area.

All are conveying Tencent's values of integrity, positivity, tolerance and collaboration. Based on the characteristics of the Bay Area itself, the way we design results in design products that face the future and will last forever, to easily cope with different work and leisure situations.

An open, interoperable and collaborative working environment will support innovative talents to continue to forge ahead, promote technological breakthroughs and explore the possibilities of the future.

MAD believes in the potential value of contemporary design should be found in designs with vision, fluidity, flexibility and a sense of technology. These designs open up the dialogue between human beings and nature, the earth and the sky and ultimately affect our perception and understanding of the space around us.

By balancing people, cities and the environment, we discover how nature and humans can create a spiritual and emotional connection. We will work together to create a new chapter in the Tencent story a unique space that emerges from its experiential qualities. This is a higher-level planning and development pattern flexible, self-adaptive and non-hierarchical, all-in-one connected community, a people-oriented and sustainable an immersive space at its core.

HAINAN SCIENCE AND TECHNOLOGY MUSEUM

Hainan, China
Facade & Interior Design - SD + DD + CD
2019 - 2024
Completed

Client: Hainan Association for Science and Technology
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings, presentations and LDI / CCDI coordination.
Credits: Ma Yansong, Dang Qun, Yosuke Hayano, Kin Li, Fu Changrui, Tiffany Dahlen, Wang Yiding, Reem Mosleh, Sun Feifei, Alan Rodríguez Carrillo, Rozita Kashirtseva, Wu Qiaoling, Edgar Navarrete, Zhu Yuhao, Zheng Chengwen, Zhang Yaohui, Li Hui, Yang Xuebing, Dayie Wu, Zhou Haimeng, Lim Zi Han, Yin Jianfeng.

The new Hainan Science and Technology Museum will be located facing the South China Sea on the west coast of Haikou in China's Hainan province. The project was recently unveiled by architectural firm MAD, led by architect Ma Yansong. It is the second major public project that the firm has built in Hainan province, the first being the famous Cloudscape library, due to be completed in spring 2021.

The area chosen for the Hainan Science and Technology Museum has an important public vocation. The new museum complex will be surrounded by Haikou city's sports stadium and the National Wetland Park. The museum, as the architects say, was conceived as a meeting point between the nature of the lush tropical forest and the city with its advanced technologies. The project is scheduled for completion in 2024, when the Hainan Science and Technology Museum will become a scientific landmark for the whole of Hainan province, as well as a major tourist attraction for the city of Haikou.

A place where "a primeval rainforest and technology of the future meet", in the words of architect Ma Yansong to describe the design of this futuristic building which creates a rapport with the surrounding nature, evoking it through its cloud-like shape. The attraction will be particularly linked to the nearby lush tropical forest, which will be mirrored in the building's silver façade made of fibre-reinforced plastic. In addition to a permanent exhibition space, the complex will also include a planetarium and two cinemas for the latest generation of 3D and dynamic viewing. The public will have direct access to the central atrium, a bright and transparent space flooded with natural light from the skylight located in the roof. For the exhibition space, drawing on the lessons of Wright and the Guggenheim Museum, the architects designed a spiral and sloping layout, connecting all five floors of the museum. The tour will begin on the fifth floor, which can be accessed via a lift that also provides access to the panoramic terrace for 360° views of the sea and the city. The landscape will be a constant presence, visible throughout the exhibition. The museum will comprise more than 27 thousand square metres of above-ground facilities on a total area of over 46 thousand square metres. For the outdoor space, the architects have designed pathways covered by canopies that run in different directions from the main pavilion, to welcome the public and shelter them from the wet and rainy climate of Haikou city. The pathways will connect the building with outdoor public spaces such as the square and rest/relaxation areas. The lush nature of the tropical rainforest will offer visitors a pleasant environment to freely enjoy and experience nature.

LISHUI AIRPORT

Zhejiang Lishui, China
Interior design & Geometry optimization, Consultans and contractors coordination - DD + CD
2016 - 2025
Completed

Client: Lishui Airport Construction Headquarters
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings and presentations.
Credits: Ma Yansong, Dang Qun, Yosuke Hayano, Liu Huiying, Li Jian, Sun Shouquan, Zhang Xiaomei, Lei Lei, Yang Xuebing, Sun Mingze, Yin Jianfeng, Punnin Sukkasem, Zhu Yuhao, Zhang Yaohui, Alan Rodriguez Carrillo, Pittayapa Suriyapee and Wang Xiny.

"Birds in the mountains": Ma Yansong MAD released the design of Zhejiang Lishui Airport

MAD Architects has unveiled the design for the upcoming Lishui Airport in Zhejiang.

The airport is located in the hilly landform in the southwest of Lishui City, and the terrain of the base varies greatly. MAD's planning and design of the airport terminal area respects the original site as much as possible while ensuring convenient and smooth airport traffic, and highlights the characteristics of the mountain airport, creating an artistic conception of "flying birds, clouds, and hills".

The design of the terminal building draws inspiration from the green water and green mountains of Lishui. It adopts a large silver-white cantilevered roof partially covered by aluminum plates, resembling a white-feathered bird that lives in the mountains and forests, ready to soar in the sky.

Entering the interior of the terminal building, the warm wood-toned hall has a flexible and smooth space shape and a comfortable and pleasant scale.

Lishui Airport is expected to start construction at the end of this year and be completed and put into use at the end of 2024.

JIAXING CIVIC & CULTURAL CENTER

Jiaxing, China
Facade & Interior Design, Consultants and suppliers coordination - DD + CD
2021 - 2026
Under construction

Client: Jiaxing Highway Investment Co., Ltd.
Firm: MAD Architects
Responsabilities: 3D modeling, parametric modelling & geometric control, scripting, diagrams, renderings and presentations.
Credits: Ma Yansong, Dang Qun, Yosuke Hayano, Liu Huiying, yin jianfeng, alessandro fisalli, fu xiaoyi, chen-hsiang chao, he yiming, thoufeeq ahmed, chen hao, he xiaowen, zhang yaohui, guo xuan, edgar navarrete, claudia hertrich, deng wei, zhang xiaomei, chen nianhai, li cunhao, alan rodriguez carrillo, sun feifei, punnin sukkasem, manchi yeung, li yingzhou

The center's three organic-shaped venues are enclosed together by a circular roof to form one unified entity, inspired by the shape of the historic canal towns of the Yangtze River. These floating roofs form one continuous skyline, bringing a sense of uniformity to the structures. Regardless of where visitors are standing, the project's dynamic forms change the scenery with every movement.

To maintain the cohesiveness of the structures in the interior, all three venues, which serve different functions, are coherently organized under the curvy roof. The spaces for exhibition, theater, education, entertainment, and other facilities compliment each other organically. The center's first floor serves as a semi-public-semi-private space, connecting the facilities to the surrounding environment on all sides, either by bordering the municipal traffic, or connecting the central lawn with the parklands. This blurred space can be used for daily activities, or as an open-air plaza.

The terrace on the second floor creates a 350-meter-long landscape corridor, which the public can climb to as a walk or exercise, or visit the amphitheater and sunken plaza on the east side. The cascading terrace facing the central lawn in the building's interior interlocks and overlaps into multiple semi-outdoor spaces, separated by minimalist floor-to-ceiling glass.

The waterfront building, which sits adjacent to the South lake, is covered with locally produced white ceramic panels. The choice of material responds to the traditional barrel tile roofs of the local village, and enhances the project's economic and energy efficiency. The original trees on the site are preserved as much as possible, complimenting the design of the landscape and forming a new natural park.

The plot is nestled alongside the existing wadi, presenting a remarkable opportunity to harmoniously merge a spiritual place of worship with the surrounding nature. This unique juxtaposition creates an awe-inspiring setting where the essence of spirituality converges effortlessly with the serene beauty of the environment.

In the past, the mosque played a central role in the communal life and essence of the neighborhood. However, over time, the mosque became more isolated as a prayer space without the social activities. Our proposal aims to revive the lost connection by introducing dedicated urban spaces, ultimately creating a mosque that will serve as a unifying force for the community.

How can we design a mosque that effectively combines spirituality, community, and cultural education into one space? Instead of seeing these aspects as separate, how can we visualize them as interconnected parts that together form a strong and unified whole?

We see the mosque as a threshold between the sky and the land where the light descends ambiguously through the layered mesh to form a spiritual place. While at night, the inverse happens, the mosque becomes the source of light and the beacon on the boulevard.

The traditional Najdi architecture is all about pure geometries, simplicity and forcefulness. This inspired our approach of the two triangular figures, in their two and three-dimensional form. To bridge the gap between the old and the new, we grasped the embedded meanings of the architectural elements and reinterpreted it into a contemporary visual expression of a Najdi Silhouette.

[AI] ARCHITECTURAL DESIGN RESEARCH IMPLEMENTATION

Midjourney + Stable Diffusion & Comfy + ChatGPT AI Engine Models
Design prompting engineering for architectural image concept generation

Firm: [NA] Architects Ltd.
Department: Computational Design & Machine Leaning + AI Research
Responsabilities: Concept design ideas & Prompting Engineering
Credits: Alan Rodriguez Carrillo & Na Wang, ChatGPT 4.0 AI model. Midjouney server on Discord

Artificial Intelligence (AI) is a broad and interdisciplinary field that aims to create machines capable of intelligent behavior. The mid-journey for AI architecture and design involves a deep exploration of both the theoretical and practical aspects of creating intelligent systems.

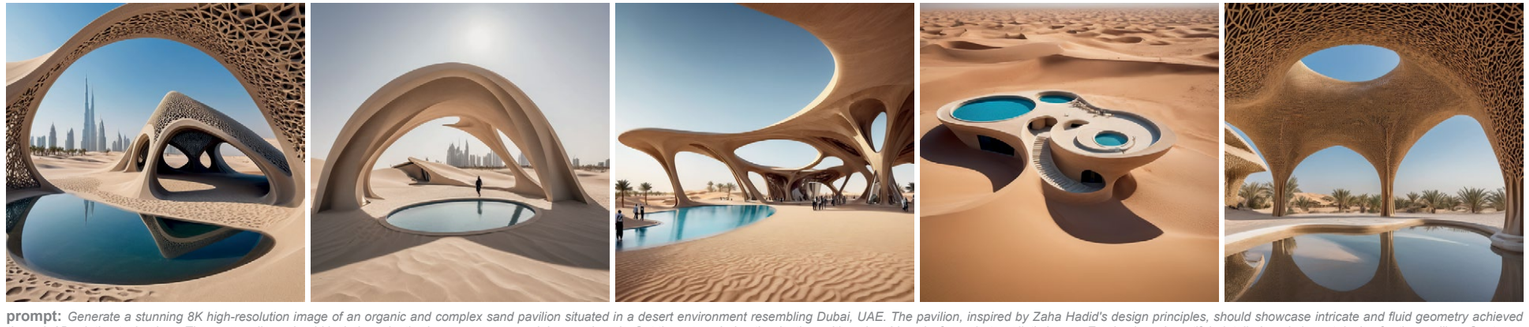
Mid-journey involves creating smart computers capable of tasks requiring human-like intelligence. This includes learning from data, solving problems, and understanding language. The architecture comprises machine learning models, neural networks, and natural language processing. Design considerations focus on making AI systems transparent, fair, scalable, and secure, promoting collaboration with humans and enabling continuous learning. Challenges include addressing bias and ensuring data quality. The future sees AI working on limited devices, being more understandable to users, and combining various data types for powerful applications, shaping industries and fostering creativity and innovation. In essence, mid-journey AI is refining models, addressing ethical concerns, and exploring new frontiers in technology.

prompt: *Create an awe-inspiring 8K resolution night vista, skillfully portraying the harmonious interplay of two soaring skyscrapers. Channel the intricate design essence reminiscent of Zaha Hadid, employing a fusion of glass, metal, and reflective white materials for a striking visual impact. Illuminate the building interiors with a warm, captivating radiance, capturing the vibrant life within. Envelop the surroundings with verdant green spaces and a mirror-like lake, enhancing the photorealistic allure under a pristine, starlit sky. Elevate the viewer's experience by crafting a scene that seamlessly blends architectural prowess with natural beauty.*

prompt: *Create a captivating 8K high-resolution image of a Martian colony, featuring 3D-printed structures using reflective earth materials. Infuse the design with organic and intricate geometries inspired by Zaha Hadid. Show astronauts seamlessly navigating both indoor and outdoor spaces, blending laboratories, and advanced mechanical installations. Render the scene during the Martian night, highlighting detailed interior lighting. Deliver a photorealistic masterpiece capturing the essence of a futuristic human settlement on Mars.*

prompt: *Generate a high-resolution 8K image of a vacation home situated on a beach. The house should be designed using 3D printing technology, inspired by the organic design of Zaha Hadid's architecture. The structure should comfortably accommodate a family of 5 members. The exterior should feature a pool for swimming. Include lush vegetation with tropical plants and trees. Ensure the design incorporates complex geometry and intricate details. Set a daytime with a clear sky and the rendering style should be photo-realistic.*

prompt: *Generate a stunning 8K high-resolution image featuring a reflective full human-shaped body merged and intricately linked with a machine interface, displaying organic branching interconnections inspired by the design aesthetics of Zaha Hadid. The scene should be set in an interior mechanical environment, showcasing complex, organic, and fluid geometry in the connection between the machine and human body. Capture the ambiance of a cyber computer approach with code programming displays and interior neon lights, creating a captivating nighttime atmosphere. Surround the main structure with humanoid robots admiring the intricate interaction. Ensure the image is photo-realistic, emphasizing the detailed beauty of the machine and human body connection within this futuristic setting.*



prompt: *Generate a stunning 8K high-resolution image of an organic and complex sand pavilion situated in a desert environment resembling Dubai, UAE. The pavilion, inspired by Zaha Hadid's design principles, should showcase intricate and fluid geometry achieved through 3D printing technology. The surroundings should include majestic skyscrapers, serene lakes, and pools. Set the scene during the daytime with a clear blue sky for a photorealistic image. Emphasize a beautiful, detailed, and elegant design for the pavilion. Capture a street full zoom perspective, providing a stunning view of the pavilion in its desertic landscape relationship.*
